

## ENVELOPE STACK ACCESSORY FOR INKJET PRINTER

### ABSTRACT OF THE DISCLOSURE

A stack accessory for a printer attaches as a module to a printer and provides a source of  
5 media. Media originates from a stack within the module passing media from the bottom  
of the stack to the printer. The top of the stack remains open to replenish the media stack  
without interrupting printing operations. The stack accessory serves particularly well as  
an envelope feed mechanism supporting a large inventory of envelopes therein. Large  
scale and continuous envelope printing operations result. Overall, a stack accessory  
10 under the present invention converts a generally conventional printer into a high-volume  
printing device enjoying uninterrupted printing operations associated with replenishing a  
supply of media fed therethrough.
